Risk warning: trading foreign exchange and CFDs on margin carries a high level of risk and may not be suitable for all investors. FX-Agency Advisor 4 is a technical analysis tool and does not constitute financial advice.

Contents

What is FXA4, in simple words?

FXA4 is a tool that sits on your trading screen (inside MetaTrader 4 or MetaTrader 5). It watches many currency pairs at the same time. For each pair it tells you three things in plain view:

- Bias — is the market leaning up (buy) or down (sell)?
- Heat — how strong is that lean right now?
- Signal — is there a clear chance to enter a trade? BUY■T or SELL■T.

Think of it like a dashboard in a car. You do not need to look at the engine. You just read the dials and you know what is happening.

How to use this guide

The menu on the left is your map. Lessons are grouped into four parts: Getting Started, Using FXA4, Mastery, and Help. Read them in order the first time. Later, you can jump to any lesson you need.

Each lesson starts with a quick “in short” summary, then simple steps and clear pictures. The bar at the top shows how far you have read.

1. Before you start — your checklist

Let us make sure you have everything ready. Tick off this short list and the install will be smooth.

What you need

This is the free trading program FXA4 runs inside. Your broker gives it to you. If you do not have it yet, download it from your broker's website and log in.

You need an account with a broker (a company that lets you trade). A demo (practice) account is perfect for learning. It uses fake money, so you risk nothing.

These came in your download after purchase (a .zip file). If you cannot find it, check your email or your account page on our website.

This is your personal unlock code. It looks like FXA4-XXXX-XXXX-XXXX-XXXX. Keep it safe — you will need it in Lesson 5.

A normal Windows computer works fine. If you want FXA4 to run 24 hours a day without leaving your own PC on, you can use a VPS (a computer in the cloud). This is optional — more on that later.

Which one do I have — MT4 or MT5?

Open your MetaTrader program and look at the very top bar. It will say either MetaTrader 4 or MetaTrader 5. Remember which one — you will follow the matching install lesson next (Lesson 3 for MT4, Lesson 4 for MT5).

2. Install on MetaTrader 4

Follow these steps in order. It takes about 5 minutes. Using MT5? Skip to Lesson 4.

Step by step

Find the .zip file you got after buying. Right-click it and choose Extract All. You now have a normal folder with the FXA4 files inside.

In MetaTrader 4, click the menu File at the top, then Open Data Folder. A folder window opens. This is where MT4 keeps its files.

Inside that window, double-click the folder called MQL4.

Put the FXA4 files into the matching folders:

Just drag each file into the right folder. The instructions inside your zip tell you exactly which file goes where.

Close MT4 fully and open it again. This makes it load the new files.

On the left side of MT4 you will see the Navigator panel. Open Indicators (or Expert Advisors). You should now see FX-Agency Advisor 4 in the list.

Open any currency pair chart. Drag FXA4 from the Navigator onto the chart. A settings box opens — for now just press OK.

3. Install on MetaTrader 5

Almost the same as MT4, just with "5" folders. About 5 minutes. Already installed on MT4? Skip to Lesson 5.

Step by step

Right-click your FXA4 .zip file and choose Extract All.

In MetaTrader 5, click File then Open Data Folder.

Double-click the folder called MQL5.

Close it fully and open it again.

Open the Navigator on the left, find FX-Agency Advisor 4, and drag it onto any chart. Press OK on the settings box.

4. Activate your licence

This is the final setup step. You enter your key once, and FXA4 unlocks on your computer. Let us do it.

Step by step

Right-click on the FXA4 panel on your chart and choose Properties (or double-click the chart). Open the Inputs tab.

Find the box named Licence Key. Paste your key there: FXA4-XXXX-XXXX-XXXX-XXXX. Type it carefully if you cannot paste — no spaces.

Click OK. FXA4 checks your key with our server and locks it to your computer. This takes a second or two.

The panel changes to show ENGINE LIVE and the pairs start filling in with data. You are activated. ■

5. The dashboard explained

This is the heart of FXA4: one panel that watches many pairs at once. Let us learn to read every part of it.

The three areas

The panel has three simple parts, top to bottom: the header (shows it is alive), the controls (your settings — covered in Lesson 8), and the table (one row per pair). Let us focus on the table, because that is where you read the trades.

Every column, in plain words

6. Reading the signals

A "signal" is FXA4 telling you a trade chance has appeared. There are three kinds. Here is exactly what each one means.

The three signals

How confident should you be?

Use the HEAT bar and the BIAS together with the signal:

- A BUY-T on a row with BUYS ONLY bias and strong heat = the cleanest kind of trade. The signal agrees with the trend and the push is strong.
- A signal with weak heat is lower quality. It can still work, but be choosier.
- The engine only shows triggers in the biased direction, so it naturally keeps you on the right side. That is on purpose.

7. Settings & controls

Three simple controls change how FXA4 behaves. You can click them right on the panel. Here is what each does.

1. STRENGTH — how picky the engine is

Only the strongest signals. Fewer trades, but the cleanest ones. Best for beginners.

A balance. More signals than High, still good quality. A common everyday choice.

The most signals — but more "noise" (weaker ones). For active, experienced traders only.

2. BIAS — trade with the trend, or both ways

Only shows trades in the trend's direction. Safer. Recommended while learning.

Allows trades both up and down. More chances, but you must judge the market more yourself.

3. TAKE PROFIT — how far you aim

This sets your target. "R" means "how many times your risk". If you risk 20 pips and aim for 2R, your target is 40 pips.

No fixed target. You ride the move and exit by hand. Most freedom, needs most attention.

Take profit quickly, equal to your risk. Hits often, smaller wins.

Aim for twice your risk. A solid, balanced target. Great default.

Aim for three times your risk. Bigger wins, but they hit less often.

8. Your first trade

Time to put it together. We will place one trade, step by step, using the numbers FXA4 gives you. Do this on a demo account first.

A worked example

Say FXA4 shows this row:

Step by step

In MT4/MT5, click New Order (or press F9) on the GBPUSD chart.

The signal is SELL-T, so you choose Sell.

Start small. On a demo, try 0.01 lots. We size this properly in Lesson 10 — for now, small.

Stop Loss = 1.2760. Take Profit = 1.2670. Copy the exact numbers from the panel.

Click Sell to confirm. Done — your trade is live, with safety and target already set.

The hardest part. Let it reach your Take Profit or Stop Loss. Do not move them out of fear. Let the plan work.

9. Risk management — the most important lesson

This is what separates traders who last from those who blow up. Read it twice. Good signals do not matter if your risk is wrong.

The golden rules

A common, sensible rule: never risk more than 1% to 2% of your account on a single trade. So on a $1,000 account, risk $10–$20 per trade. This way, even a run of losses cannot hurt you badly.

FXA4 gives you one for every trade. Use it, every time. It is your seatbelt.

Never trade rent, food, or borrowed money. Trade with money that, if lost, would not change your life.

Lost a trade? Do not "win it back" with a bigger one. Stick to the same small risk every time. Calm beats emotional.

How big should my trade (lot size) be?

Lot size decides how much each pip is worth. Bigger lots = bigger risk. The simple way to stay safe:

- Decide your risk in money first (say $20).
- Look at the stop-loss distance in pips (say 30 pips).
- Use a free "position size calculator" (search online, or your broker has one). Type in $20 risk and 30 pips — it tells you the exact lot size.

10. Best pairs & sessions

When and what you trade matters. FXA4 works best on liquid pairs during active hours. Here is the simple guide.

Good pairs to focus on

The "major" pairs move smoothly and have the lowest costs (tight spreads). Great for clear signals:

Pairs to treat with care

"Exotic" pairs and thin crosses can jump around and cost more to trade. Be choosier here, especially as a beginner:

The four trading sessions

The market runs in waves around the world. The panel footer shows which session is active now.

11. Pro workflow & tips

A calm, simple routine beats staring at screens all day. Here is how experienced users run FXA4.

A simple daily routine

Open the panel when London or New York begins. That is when good signals appear.

Look only for strong-heat BUY-T / SELL-T signals that match the bias. Ignore the rest.

Enter at the LEVEL, set the STOP-LOSS and TAKE-PROFIT, then leave it. Let the plan run.

Note what worked. A few minutes of review each day makes you better fast.

Tips that make a real difference

12. Troubleshooting

Stuck? Most issues have a quick fix. Find your problem below.

13. Frequently asked questions

Quick answers to the things people ask most.

14. Get support

A real person reads every message. If you are stuck or have a question, here is the fastest way to a clear answer.

How to reach us

Go to fxasystems.com/fxa4/contact and send us a message. It lands straight in our support inbox.

(1) Your order email, (2) your licence key, and (3) what is happening — a screenshot helps a lot. With those, we can help much faster.

Usually within about 24 hours (often sooner, Monday to Friday). You will get a confirmation the moment your message arrives.

You finished the Academy!

You now know how to install, activate, read, and trade with FX-Agency Advisor 4 — and how to stay safe while doing it. Start on a demo, take it slowly, and let the engine do the heavy lifting. You have got this.

This FX-Agency Advisor 4 guide shows you how to install, activate and use the FXA4 multi-pair forex scanner on MetaTrader 4 (MT4) and MetaTrader 5 (MT5) — from your first install to reading the dashboard, placing your first trade and managing risk. Written in plain English for traders of every level.

About FX-Agency Advisor 4

FX-Agency Advisor 4 (FXA4) is the fourth release in the FX-Agency line of trading tools by FXA Systems. It is a non-repainting buy/sell signal indicator and live dashboard for MetaTrader 4 and MetaTrader 5. Every signal is delivered with its entry, stop-loss and take-profit pre-calculated, and can be placed on the account in one click. FXA4 runs on forex pairs, crosses, indices, metals and stocks, on unlimited accounts, with a licence that never expires.
